*For Immediate Release*

### POWER SUPPLY ARRANGEMENT – FEBRUARY 2017

Following the announcement of a planned shut down by the Ghana National Gas Company (GNGC) for maintenance and also to allow for the connection and commissioning of the gas pipeline system and other equipment from the TEN fields to the Atuabo processing plant from 3<sup>rd</sup> to 20<sup>th</sup> February, 2017, we wish to advise that there will be a generation shortfall of 230MW from the AMERI plant whose operations depend solely on gas supply from the GNGC.

The connection of the TEN fields to the Atuabo plant is critical as it will significantly increase the amount of natural gas to run the power generating facilities at Aboadze and improve the overall reliability of power supply to the general public.

This anticipated shortfall of 230MW is creating public anxiety that the country may be returning to power crises (dumsor).

We wish to assure the public that we have put in adequate measures to mitigate the impact of the shortfall as detailed below:

We plan to generate additional power from the Akosombo and Kpong hydroelectric plants, and also from the Tema and Kpone thermal plants which operate on light crude oil (LCO) and diesel respectively, while imports from Cote d'Ivoire will be purchased to make up for the supply deficit.

Additionally, some of the thermal units at Aboadze that have been shut down for planned maintenance would be returned into service during this period.

We take this opportunity to assure electricity consumers and the general public that the power situation will be managed in the most efficient manner during this period to address the anticipated challenges in power supply.

We thank our valued customers for their understanding and cooperation. **END.**
